Sortir de Google Scholar, Scopus ou Web of Science

Que valent Lens, Dimensions, OpenAlex et Matilda pour la recherche bibliographique ?

Présentation

Depuis quelques années, de nouveaux moteurs de recherche académique viennent compléter l'offre dominée jusque-là par Google Scholar, Scopus et le Web of Science.
Bibliodiversité, nouveaux types d'informations, science ouverte… A l'heure où des institutions se désabonnent de leurs bases bibliographiques commerciales et où des initiatives permettent une meilleure ouverture des données sur les publications, que peuvent apporter ces outils au chercheur ?

Cette formation est une formation généraliste, ne nécessitant pas de compétence technique particulière et n'aborde pas, par exemple, la question des API.

- Contexte : bibliodiversité et *open citations* ; sources des données
- Intérêts et limites actuelles des outils :
  - les méga-index : Lens (https://www.lens.org/), Dimensions (https://app.dimensions.ai/)
  - les initiatives ouvertes : OpenAlex (https://openalex.org/), Matilda (https://matilda.science/)
- Bilan fin 2025 des outils de recherche bibliographique

Présence de commentaires et d'une bibliographie

Goodbye, Microsoft Academic – Hello, open research infrastructure?

3 comments | 179 shares

Estimated reading time: 6 minutes

The announcement of the closure of Microsoft Academic later this year, may have left the research community largely unmoved, although its demise has significant implications for those working with the service's substantial database. Here, **Aaron Tay, Alberto Martín-Martín,** *and* **Sven E. Hug**, *discuss what set Microsoft Academic apart from its competitors and the potential consequences of Microsoft's withdrawal from scholarly metadata for the development of open research infrastructures.*

Recently, Microsoft announced that it will shut down Microsoft Academic, the second largest academic search engine after Google Scholar. Although the global scientific community took little

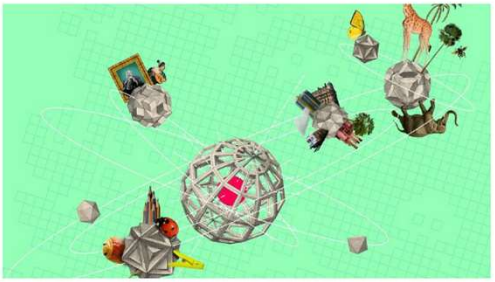
Science ouverte

Sorbonne Université se désabonne du Web of Science



Menant une politique ambitieuse et volontariste depuis de nombreuses années, Sorbonne Université est pionnière en matière de science ouverte. Poursuivant son engagement en faveur de l'ouverture de données relatives à la recherche, elle fait le choix de ne pas renouveler son abonnement à la base de publications *Web of Science*, ainsi qu'aux outils bibliométriques de Clarivate en 2024. En s'affranchissant résolument des produits bibliométriques propriétaires, elle ouvre la voie à l'exploration de nouveaux outils ouverts, libres et participatifs.

Le CNRS se désabonne de la base de publications Scopus

11 janvier 2024 INSTITUTIONNEL

Le CNRS s'est depuis plusieurs années engagé en faveur de la science ouverte. Cela concerne aussi les bases de publications pour lesquelles le CNRS doit se tourner vers des solutions ouvertes et durables. Aujourd'hui, cet engagement marque une étape importante avec le désabonnement de la base bibliographique Scopus d'Elsevier au 31 décembre 2023. Dès que des solutions ouvertes seront suffisamment abouties, l'établissement arrêtera d'avoir recours aux bases bibliographiques commerciales. En attendant, l'abonnement au *Web of Science* de Clarivate Analytics est maintenu.

Le CNRS mène une politique pour la science ouverte ambitieuse pour ouvrir les publications scientifiques, partager et réutiliser les données, repenser l'évaluation de la recherche, développer les logiciels libres et les méthodes de fouille de textes. L'enjeu est de taille pour que les chercheurs et chercheuses du CNRS se réapproprient les résultats de leurs propres travaux et rendent la science accessible à l'ensemble de la société.

OUR PROMISE

Free, Open And Secure Innovation Cartography

Our promise to you when using this website, we will always provide the best we have at no cost, to be used and shared by anyone with absolute peace of mind no one is watching.

Free - No Charge

With us, everyone can access and use the website at no cost . We don't do 'Freemium'. Everybody uses Lens for free. We think the ability for anyone to create new value should not be constrained by access to critical knowledge.

Open - No Constraints

Our core datasets are open, global and can be accessed, used and shared by anyone. We don't discriminate by who you are or where you are; we aspire to help problem solvers in any jurisdiction and any language.

Secure - No Snooping

Privacy matters...your Lens use is your business and yours alone. We don't share or sell any knowledge of your use of The Lens. We don't keep track of what you do (unless you ask us to). We don't advertise or let others advertise on Lens. We avoid any third party software that could expose your use to others.

Steadfast - Always Reliable

Since its founding as the Patent Lens in 1999, The Lens has been the longest continuously-operating open facility serving innovation knowledge for over two decades. The Lens has evolved to become a platform to bridge the cultures of scholarly research, invention, enterprise and industry.

Abstract
The present study investigated the influence of cognitive, motor, and Karate (accordingly the guidelines of the German-Karate-Federation, DKV) training on the cognitive functioning and mental state of older people between 67 and 93 years of age. The three training groups each consisted of 12 elderly participants; the waiting control group included 9 participants. Before the training, participants were evaluated with cognitive measurements (cognitive speed: number-connection test, number-symbol test; memory performance: digit-span test, blocking-tapping test, figure test) and a measurement of emotional wellbeing. After this pre-testing they participated the specific training in on average sixteen 1-h training sessions.The cognitive training exercised inductive thinking ability, the motor training worked on easy stretching and mobilization techniques, and the Karate training taught tasks of self-defense, partner training, and Katas. After completion of the training sessions, all tests were applied again.The results show no significant difference in cognitive improvement dependent on group between the three training conditions. However a significant improvement was found in the emotional mental state measurement for the Karate group compared to the waiting control group. This result suggests that the integrated involvement in Karate leads to a feeling of self-worth and that, even in elderly people, integration of new sports helps to improve quality of life.

SEARCH TIPS

Booleans: Boolean operators must be in capitals: *e.g.* `'robot AND engine'` , *or* `'car OR boat'` *or* `'cat NOT dog'` . *&& is an alias for* AND *and || is an alias for* OR *and ! is the alias for NOT.* Parentheses can be used to group search terms. *e.g.* `'(wheat AND grain) OR (sorgum AND barley)'`

Fields : Search a specific field in the index (or fields) use 'field:term': *e.g. 'title:(leishmani* AND diagnos*) || abstract:(leishmani* AND diagnos*) && classification_cpc:(A61K* OR C12N*)*

Wildcards: *e.g. *, ?, and regular expressions like /ar[gb]on/*

Fuzziness and Proximity Search: To perform a fuzzy search use the tilde, "~", symbol at the end of a Single word Term. For example to search for a term similar in spelling to "roam" use the fuzzy search: `roam~` . To perform a proximity search, add the tilde, "~", symbol to the end of a phrase suffixed with a number indicating the maximum edit distance of words in the phrase. For example, `"quick fox"~4` searches for *quick* and *fox* within 4 words from each other.

Range Searches: Range Queries allow one to match documents whose field(s) values are between the lower and upper bound specified by the Range Query. Range Queries can be inclusive or exclusive of the upper and lower bounds. Sorting is done lexicographically. `date_published:[2002-01-01 TO 2003-01-01]`

This will find documents whose date_published fields have values between 2002-01-01 and 2003-01-01, inclusive. Note that Range Queries are not reserved for date fields. You could also use range queries with non-date fields: `title:{Aida TO Carmen}`

This will find all documents whose titles are between Aida and Carmen, but not including Aida and Carmen. Inclusive range queries are denoted by square brackets. Exclusive range queries are denoted by curly brackets.

Language: To search in a language other than English, use the "Query Tools" section at the bottom of the sidebar filters.

Query Syntax: For more details on the query syntax used, see Elasticsearch Query string query.

For more information see our Search Syntax, Boolean Logic tutorial and Boolean Operators Tutorial

Upcoming Changes to Accounts

In preparation for the upcoming changes to accounts announced in the last release, we will soon be contacting users and disabling accounts that have not been used in over a year. If you would like to maintain your account on Lens.org, you must sign in to your account and make sure your details are up-to-date, and carefully read the terms of use to ensure that you are qualified for an account. As a reminder we are asking all account holders to use their institutional email address with their Lens account where applicable. We will also be implementing a 'real name and real institution' policy as we move forward.

Please note, the individual commercial accounts are intended to provide Professional Workspaces affordably to sole practitioners or small businesses. We ask that those working for larger entities contact us for an affordable Institutional / Enterprise Toolkit account.

- The number of records displayed on the results page has been limited to 10 records for anonymous users. You will need to sign in to your Lens account to view more than 10 records per page.
- Exports are now limited to one export of more than 1,000 records every 5 mins for users without a commercial subscription.

Summary

TLDR Key highlights Top keywords

The study examined the effects of cognitive, motor, and Karate training on cognitive functioning and emotional well-being in elderly individuals aged 67 to 93. While no significant cognitive improvements were observed across the training groups, the Karate group showed a notable enhancement in emotional well-being compared to the control group, indicating that Karate may boost self-worth and quality of life in older adults.

Boolean searches in Dimensions

Boolean operators

Keywords can also be combined using boolean operators, and these must be input in ALL CAPS:

Operator	How to use
OR	If either term is found then the item will be returned. For example, *green OR blue* will return any item that has either 'green' or 'blue' within it.
AND	Both terms must be present, so a query of *green AND blue* will only return items where both terms are found within a single item.
NOT	Excludes items that include this term. So *green NOT blue* means all items with 'green' in them will be returned unless they also have the word 'blue' as well.

Please note that NOR, XOR, and NAND are not supported.

Term modifiers

Term modifiers can be used in combination with keywords and / or boolean operators to create more complex queries. The following modifiers are available:

Modifier	Name	How to use	Available in...
()	Parentheses	If you enter *green AND blue OR purple* it will return any items that have both green and blue plus any items that have purple. But if you enter *green AND (blue OR purple)* then it will return any item that has both green and blue or green and purple.	All Dimensions versions
" "	Double quotes	If you put text in quotes it will find an exact match only. *green blue* will return only items which include that exact term. Items which include "blue green" or where both words are found in separate places, will not be retrieved. Please note: an asterisk within double quotes will be ignored.	All Dimensions versions
"~	Proximity search	This searches for words in some close proximity. For example *"apple pie delicious"~3* will search for the words 'apple', 'pie' and 'delicious' with a maximum separation of 3 words: • "apple delicious pie" (distance: 2) • "apple extra words here pie delicious" (distance: 3) • "apple some words pie separated delicious" (distance: 3). However, it will not match • "delicious apple pie" (distance: 4) • "apple too many extra words here pie delicious" (distance: 5) • "apple some words pie further separated delicious" (distance: 4)	Dimensions Analytics only
?	Single character wildcard	Cannot be used as a leading wildcard or inside of quotes. Example: gene?	Dimensions Analytics only
*	Multiple character wildcard	Cannot be used as a leading wildcard or inside of quotes. Example: engineer*	Dimensions Analytics only

Abstract
The present study investigated the influence of cognitive, motor, and Karate (accordingly the guidelines of the German-Karate-Federation, DKV) training on the cognitive functioning and mental state of older people between 67 and 93 years of age. The three training groups each consisted of 12 elderly participants; the waiting control group included 9 participants. Before the training, participants were evaluated with cognitive measurements (cognitive speed: number-connection test, number-symbol test; memory performance: digit-span test, blocking-tapping test, figure test) and a measurement of emotional well-being. After this pre-testing they participated the specific training in on average sixteen 1-h training sessions. The cognitive training exercised inductive thinking ability, the motor training worked on easy stretching and mobilization techniques, and the Karate training taught tasks of self-defense, partner training, and Katas. After completion of the training sessions, all tests were applied

Industry-leading coverage

We index over **250M** scholarly works from 250k sources, with extra coverage of humanities, non-English languages, and the Global South.

We link these works to 90M disambiguated authors and 100k institutions, as well as enriching them with topic information, SDGs, citation counts, and much more.

Open, top to bottom

Export all your search results for free. For more flexibility use our API or even download the whole dataset. It's all CC0-licensed so you can share and reuse it as you like!

Want to see how it works? 100% of our source code is open, too.

Sustainably not-for-profit

OpenAlex is made by OurResearch, a nonprofit dedicated to making research open. And we've got a decade's experience keeping tools like Unpaywall sustainably open with a freemium business model.

If you'd like to upgrade your OpenAlex experience, check our our Premium subscription.

Participer à l'échelle européenne et internationale au paysage de la science ouverte

→ **S'assurer que des solutions souveraines** existent pour permettre aux acteurs de l'enseignement supérieur et de la recherche de conserver la maîtrise des services à la science ouverte pour les publications, les données, les codes sources, les vidéos, les ressources éducatives libres, etc.

→ Participer à la **gouvernance des standards** de métadonnées et d'identifiants uniques des objets et acteurs de la recherche (Crossref, Datacite, ORCID, ROR, etc.) et à la gouvernance des services de la science ouverte (Directory of Open Acccess Journals, Directory of Open Access Books, OPERAS, etc.)

→ Favoriser la création d'un écosystème ouvert de la citation comme alternative aux environnements propriétaires en soutenant l'**Initiative for Open Citations** et le projet **OpenAlex** porté par OurResearch.

Partenariat du ministère de l'Enseignement supérieur et de la Recherche avec OpenAlex pour le développement d'un outil bibliographique entièrement ouvert

MINISTÈRE DE L'ENSEIGNEMENT SUPÉRIEUR ET DE LA RECHERCHE
Liberté Égalité Fraternité

VEILLE 15/02/2024

Le ministère de l'Enseignement supérieur et de la Recherche (MESR) a mis en place un partenariat pluriannuel avec OpenAlex en décembre dernier. Le projet de partenariat entre le MESR et OpenAlex, inscrit dès 2021 dans le Deuxième Plan National pour la Science Ouverte, souligne l'importance pour la France de participer à l'échelle internationale à la construction du paysage mondial de la science ouverte.

OpenAlex

OpenAlex Advisory Board

This document is public.

Changelog

We love DOAJ's approach to their Advisory Board. So, in the spirit of reusable Open Science, we are copying it! We made just a few small changes:

- "DOAJ" → "OpenAlex"
- *"fund"* → *"rely upon"*
- Removed precise stakeholder seat counts for now, changed to *"must reflect the regional and organizational diversity"*
- Removed requirement that Board members be funders
- Advisory Board Chair is supported by the COO, OurResearch

Purpose of OpenAlex's advisory board

- Underpins and secures OpenAlex's structure;
- Is fitting for the type of organisation that OpenAlex has become over the last 5 years and is expected to become over the next 5 years;
- Provides greater transparency into the way OpenAlex works;
- Allows the organisations who rely upon OpenAlex to have input;
- Facilitates succession planning and operations continuity.

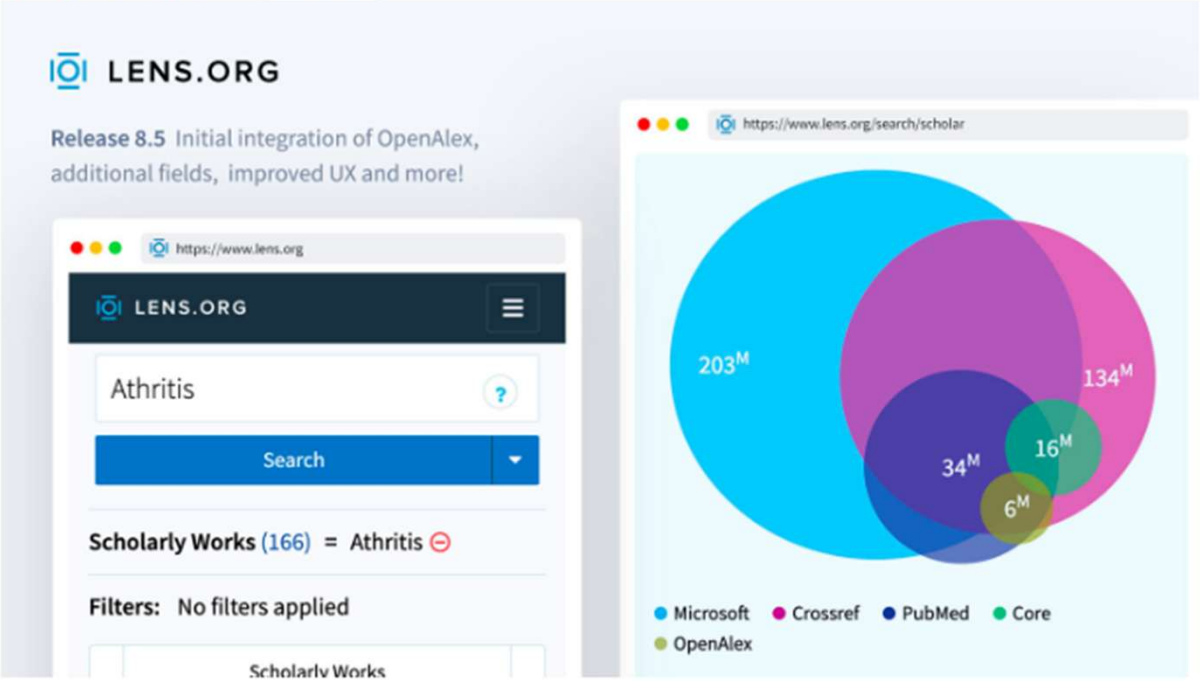
Release 8.5

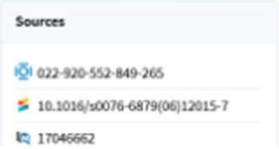
09 JUNE 2022 BY AARON BALLAGH IN RELEASE NOTES



New Features and Improvements

OpenAlex Integration

With this release, we are pleased to announce the initial integration of OpenAlex data into The Lens. Developed by the team at OurResearch, who also provide UnPaywall, ImpactStory and other open tools for the research community, OpenAlex was initiated to provide a replacement for Microsoft Academic Graph (MAG, see The Lens Scholarly MetaRecord Strategy: Beyond Microsoft Academic Graph)



source

Understanding Our Data Source: How Keenious Uses OpenAlex for Research Recommendations

Keenious · Follow
3 min read · Aug 21, 2024

1

One of the most common questions we receive when introducing Keenious is, 'Where do the recommended papers come from?' The short answer is they come from a non-profit called OpenAlex. Keenious has analyzed and indexed over 111 million research articles from OpenAlex, an open-access and open-source catalogue. But who is OpenAlex, and why did we choose to use their datasets?

When developing Keenious, ensuring high-quality data and article recommendations was crucial. OpenAlex provides a transparent and comprehensive bibliographic catalogue with essential metadata, making it an ideal fit for Keenious.

A Perfect Fit

Launched by the OpenResearch Foundation in January 2022, OpenAlex aims to continue on from MAG (Microsoft Academic Graph), which was discontinued at the end of 2021[1]. MAG was a crucial data point for many groups and researchers who needed metadata on publications, topics, citations, ect. With the retirement of MAG, a huge void emerged. This also highlighted the dependency of open-access data on the goodwill of for-profit companies.[2]

source

Testimonials

"I am the main developer of VOSviewer, one of the most popular software tools worldwide for visualizing scientific literature based on bibliographic data. VOSviewer supports a large number of bibliographic databases. However, most of these databases have important limitations:

They require an expensive subscription (Web of Science, Scopus),

- their coverage of the scientific literature is limited (Web of Science, Scopus),
- they allow only small amounts of data to be exported (Web of Science, Scopus, Dimensions),
- they are restricted to specific disciplines (PubMed, Europe PMC),
- there are major gaps in their data (PubMed, Europe PMC, Crossref, OpenCitations), and/or
- downloading data is very slow (Crossref, OpenCitations).

OpenAlex is of crucial importance for VOSviewer users because it offers a better performance than other databases on all the above-mentioned criteria.

VOSviewer users regularly run into problems because of the limitations of bibliographic databases. When they ask me for help, I often refer them to OpenAlex as an alternative database that is likely to offer a solution to their problem. I consider OpenAlex to be a fundamental building block for an ecosystem of open infrastructures for high-quality research analytics."

— Nees Jan van Eck, Centre for Science and Technology Studies (CWTS), Leiden University

Pol_Eco_Pub
@pol_eco_pub

OpenAlex is really made for analytics, and Matilda for discovery services. So IMHO the first one replaces Scopus & Wos institutionnal/scientometrics usages, the second one Scopus & WoS & G Scholar discovery usages. Both rely on open data, so checkable and reusable.

Date de création de l'entrée dans la source (ou première soumission) : 2011/12/06

Description :

The present study investigated the influence of cognitive, motor, and Karate (accordingly the guidelines of the German-Karate-Federation, DKV) training on the cognitive functioning and mental state of older people between 67 and 93 years of age. The three training groups each consisted of 12 elderly participants; the waiting control group included 9 participants. Before the training, participants were evaluated with cognitive measurements (cognitive speed: number-connection test, number-symbol test; memory performance: digit-span test, blocking-tapping test, figure test) and a measurement of emotional well-being. After this pre-testing they participated the specific training in on average sixteen 1-h training sessions. The cognitive training exercised inductive thinking ability, the motor training worked on easy stretching and mobilization techniques, and the Karate training taught tasks of self-defense, partner training, and Katas. After completion of the training sessions, all tests were applied again. The results show no significant difference in cognitive improvement dependent on group between the three training conditions. However a significant improvement was found in the emotional mental state measurement for the Karate group compared to the waiting control group. This result suggests that the integrated involvement in Karate leads to a feeling of self-worth and that, even in elderly people, integration of new sports helps to improve quality of life.

Google Scholar is not broken (yet), but there are alternatives

12 comments | 62 shares

Estimated reading time: 6 minutes

For many Google Scholar has become a critical piece of research infrastructure. Yet, revelations in the manipulability of its metrics and its inclusion of AI generated papers have led some to ask is it still functional? **Kirsten Elliott** *argues rather than being broken, these issues reflect the limitations of any academic search tool, but for those done with the platform there are alternatives.*

For those who haven't ventured into the 'other place', this post builds on some threads posted on BlueSky, in response to discussions on that platform about Google Scholar's "brokenness."

The question of whether Google Scholar is broken has the obvious answer of "It depends": on what it's being used for, how it's being used, and what alternatives are available.

Metascience

Introduction | Topic Anatomy | Find an Expert | Topic Benchmarking Beta | All Publications

Metascience, a burgeoning field at the intersection of various disciplines, seeks to critically examine the scientific process itself. It delves into the underlying assumptions, methodologies, and practices that shape scientific research and its impact on society. By scrutinizing the scientific enterprise, metascience aims to enhance the reliability and reproducibility of research findings, thereby bolstering the integrity of scientific knowledge. This field also explores the ethical and policy implications of scientific inquiry, as well as the cognitive and behavioral factors that influence scientific practice. Moreover, metascience plays a pivotal role in advancing research tools and technologies, fostering a deeper understanding of statistical analysis and data interpretation, and refining educational appr learning methods within the scientific community.

The present study investigated the influence of cognitive, motor, and Karate (accordingly the guidelines of the German-Karate-Federation, DKV) training on the cognitive functioning and mental state of older people between 67 and 93 years of age. The three training groups each consisted of 12 elderly participants, the waiting control group included 9 participants. Before the training, participants were evaluated with cognitive measurements (cognitive speed: number-connection test, number-symbol test; memory performance: digit-span test, blocking-tapping test, figure test) and a measurement of emotional well-being. After this pre-testing they participated the specific training in an average sum of 24 training units (2 units per week) and were retested after completion of training. The cognitive training worked on calculating, simplifying and mobilization techniques, and the Karate training taught basics of self-defense, partner training, and Katas. After completion of the training sessions, all tests were applied again. The results show no significant difference in cognitive improvement dependent on group between the three training conditions. However a significant improvement was found in the emotional mental state measurement for the Karate group compared to the waiting control group. This result suggests that the integrated movement in Karate leads to a feeling of self-worth and that, even in elderly people, integration of new sports helps to improve quality of life.

Keywords: elderly, physical exercise, cognitive improvement, emotional well-being

INTRODUCTION

Increasing life expectancy and demographic changes are causing the absolute number of elderly people to increase as well as their proportion of the total population. Because of this, maintaining cognitive function and emotional well-being in the last decades of life becomes an important goal. Aging is a multifaceted process. The women are less functional than those in older age, mainly fluid intelligence components such as perceptual speed and working memory capacity; other cognitive functions stay stable over a long period in life, such as verbal fluency and knowledge representations (Smith and Baltes, 2010). Today it is well accepted that there are domain-general as well as function specific mechanisms which explain the cognitive and sensory decline that occurs in old age (Lindenberger and Ghisletta, 2009).

Much research has been done to investigate how cognitive functions remain stable over long periods of time. Correlation studies suggest that older people who are physically, emotionally, and socially engaged are at less risk to suffer from dementia than older adults who do not engage in such activities (Karp et al., 2004). Larson et al. (2006) conducted an investigation with 1,750 older adults, performing tests every 2 years over a period of 6 years. They showed that people who are physically active at least three times a week had a minor incidence of developing from dementia. But if other factors were included in the calculation, for example smoking and education level, this advantage was reduced.

In addition, experimental studies with younger participants have been performed which demonstrate that cognitive training as well as physical exercise is associated with improved cognitive functioning (Colcombe and Kramer, 2003) and emotional well-being (Lee and Russell, 2003). In a study by Vemuthedge et al. (2001) it was shown that physical activity in older people (mean age 65 years) reduces the risk of depression. In their study they constructed a physical activity scale, which was based on the frequency of leisure activities, physical exercise, sports participation, gardening, and outdoor activities.

Furthermore, it was shown that an active and socially integrated lifestyle in late life could even protect against dementia (Fratiglioni et al., 2004). This suggests that emotional well-being and cognitive functioning may be related to each other. This connection is further supported by Rendell et al. (2012), whose results show that depressive symptoms may predict longitudinal change in some forms of executive functioning but not in memory tasks for seniors older than 70 years.

THE INFLUENCE OF COGNITIVE TRAINING ON COGNITIVE PERFORMANCE AND EMOTIONAL WELL-BEING IN THE ELDERLY

Baltes and Lindenberger (1997) summarized the effect of cognitive training on cognitive performance regarding fluid intelligence measurements done in former studies. Twenty-five years ago, Schaie and Willis (1986) had already demonstrated that everyday cognitive performance improvements in inductive, visual, and spatial thinking could be improved with cognitive training. Jaeggi et al. (2008) showed that cognitively healthy adults between 19 and 80 years old remained stable for 8 months by just repeating the learning tests. In Stuart's and Rosnell's (1996) study a group of older people who were cognitively active (solving

Criteria for Bibliographic Databases in a Well-Functioning Scholarly Communication and Research Assessment Ecosystem

Bibliographic databases should support innovation and experimentation. Here, we offer four criteria for innovation-friendly bibliographic databases. We urge the global research community to use databases that support and do not hinder innovation in scholarly communication and research assessment.

GINNY BARBOUR, CAITLIN CARTER, JONNY COATES - ASAPBIO, KELLY D. COBEY, KATHERINE S. CORKER, ELIZABETH GADD, BIANCA KRAMER, REBECCA LAWRENCE, EVA MÉNDEZ , CAMERON NEYLON, JANNE PÖLÖNEN, BODO STERN and LUDO WALTMAN

January 14, 2025 . 2:00 PM — 7 min read

G. Barbour et al., 01/2025

Bibliographic Databases and the Need for Experimentation

Researchers might expect that bibliographic databases are simply faithfully cataloging the scholarly corpus as it is published, but in actuality, many databases play an active role in choosing what to index and what to avoid. Some databases, notably Web of Science and Scopus, have built their brands on being highly selective, using bespoke (and often opaque) selection processes to determine what research "counts" and gets to be included in a database. For a journal, being included means discoverability

Criteria for Innovation-Friendly Bibliographic Databases

Mainstream scholarly communication practices suffer from major problems, including slow dissemination of research outcomes, lack of openness and transparency, an overburdened peer review system, and a research integrity crisis. Innovation and experimentation are essential to improve scholarly communication practices. Bibliographic databases should support and facilitate this, not hinder it, whether directly or indirectly. Innovation-friendly bibliographic databases meet the following criteria:

. **Recognize the broad variety of use cases for bibliographic databases and the need to offer flexibility to address different use cases in appropriate ways.** Popular databases like Web of Science and Scopus have a narrow perspective on which journals deserve to be indexed. Although this might be appropriate for some use cases, it is deeply problematic for many others. Research isn't one-size-fits-all, and bibliographic databases shouldn't be either.

2. **Accommodate diverse approaches to scholarly communication.** Indexing only articles in peer-reviewed journals provides an incomplete and biased picture of the scholarly record. Scholarly communication is happening on a variety of platforms, including preprint servers, peer review platforms, data repositories, and more. Bibliographic databases need to accommodate these important platforms.
3. **Acknowledge the importance of open peer review reports and other markers of trust.** Open peer review reports and other trust markers play an increasingly important role in helping consumers of scholarly outputs assess the quality and trustworthiness of these outputs. Bibliographic databases need to index these reports and trust markers.
4. **Ensure involvement of the research community in the governance of bibliographic databases.** Operating a bibliographic database that serves the diverse needs of the research community is a significant challenge. To address this challenge, the research community must be meaningfully involved in key decisions in the design and operation of a bibliographic database. Community governance builds trust.

Abstract

The present study investigated the influence of cognitive, motor, and Karate (accordingly the guidelines of the German-Karate-Federation, DKV) training on the cognitive functioning and mental state of older people between 67 and 93 years of age. The three training groups each consisted of 12 elderly participants; the waiting control group included 9 participants. Before the training, participants were evaluated with cognitive measurements (cognitive speed: number-connection test, number-symbol test; memory performance: digit-span test, blocking-tapping test, figure test) and a measurement of emotional wellbeing. After this pre-testing they participated the specific training in on average sixteen 1-h training sessions.The cognitive training exercised inductive thinking ability, the motor training worked on easy stretching and mobilization techniques, and the Karate training taught tasks of self-defense, partner training, and Katas. After completion of the training sessions, all tests were applied again.The results show no significant difference in cognitive improvement dependent on group between the three training conditions. However a significant improvement was found in the emotional mental state measurement for the Karate group compared to the waiting control group. This result suggests that the integrated involvement in Karate leads to a feeling of self-worth and that, even in elderly people, integration of new sports helps to improve quality of life.

En 2020, un article frauduleux intitulé "What's the deal with bird" a été accepté par le "Scientific Journal of Research and Reviews".

Dan Baldassarre @evornithology · Apr 4, 2020

UPDATE: I asked for a fee waiver, and after consulting with their "Higher Authorities", they agreed to publish my paper for the low low price of $1,027! A steal for such a prestigious journal!

Special Waiver: SJRR-20-RA-554

Dear Daniel T. Baldassarre,

Thank you for your response.

We have done a session with our Higher Authorities, they agreed my words and provided you a **special waiver** because as we never loss efficient authors like you. So we humbly request you to pay amount of $1027 (instead of $1780).

Please go to the following link to make the payment in online
https://irispublishers.com/pay-online.php

Hope you can understand us.

Monday 17 June 2024

African research is receiving a major visibility boost with the indexing of 10 national funders in Dimensions, the world's largest linked research database.

This project is a collaboration with Digital Science, the Africa PID Alliance (APA), the Association of African Universities (AAU), the Training Centre in Communication (TCC Africa), and the Research Organization Registry (ROR).

ABOUT PROJECTS PUBLICATIONS TALKS THOUGHTS

More open abstracts?

Comparing abstract coverage in Crossref and OpenAlex

By Bianca Kramer
NOVEMBER 24, 2024

Abstracts are increasingly important given the rise of large language models (LLM) and generative AI. While OpenAlex provides a source of open abstracts in addition to Crossref, the takedown of abstracts from OpenAlex by two major publishers points to an increased commodification of abstracts.

The case for open abstracts

Launched in 2020, the Initiative for Open Abstracts (I4OA) advocates and promotes the unrestricted availability of abstracts of scholarly output, particularly journal articles and book chapters, in trusted repositories where they are open and machine-accessible. This has gained increased relevance with the rise of large language models (LLM) and generative AI. Access to high-quality textual content for training purposes is highly sought after, with the risk of further commodification by publishers and by developers of generative AI models and tools.

Takedown of abstracts by Springer Nature and Elsevier

After Springer Nature, Elsevier is now the second publisher that has taken steps to have abstracts removed from OpenAlex. Coupled with announcements earlier this year of Elsevier announcing their own AI tool which makes ample use of abstracts, as well as selling the right to use and display abstracts from its own journals to a third party tool developer, this makes clear that abstracts are in growing danger of being treated as a commodity, rather than as open research information.
